Function of ABA

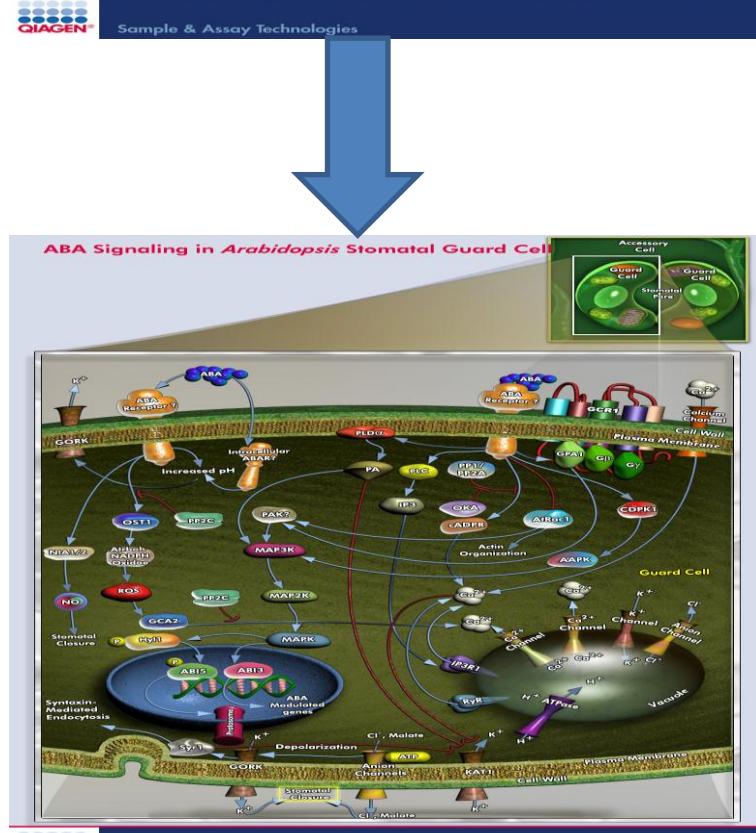

1. developmental processes

2. adaptive stress responses to environmental stimuli

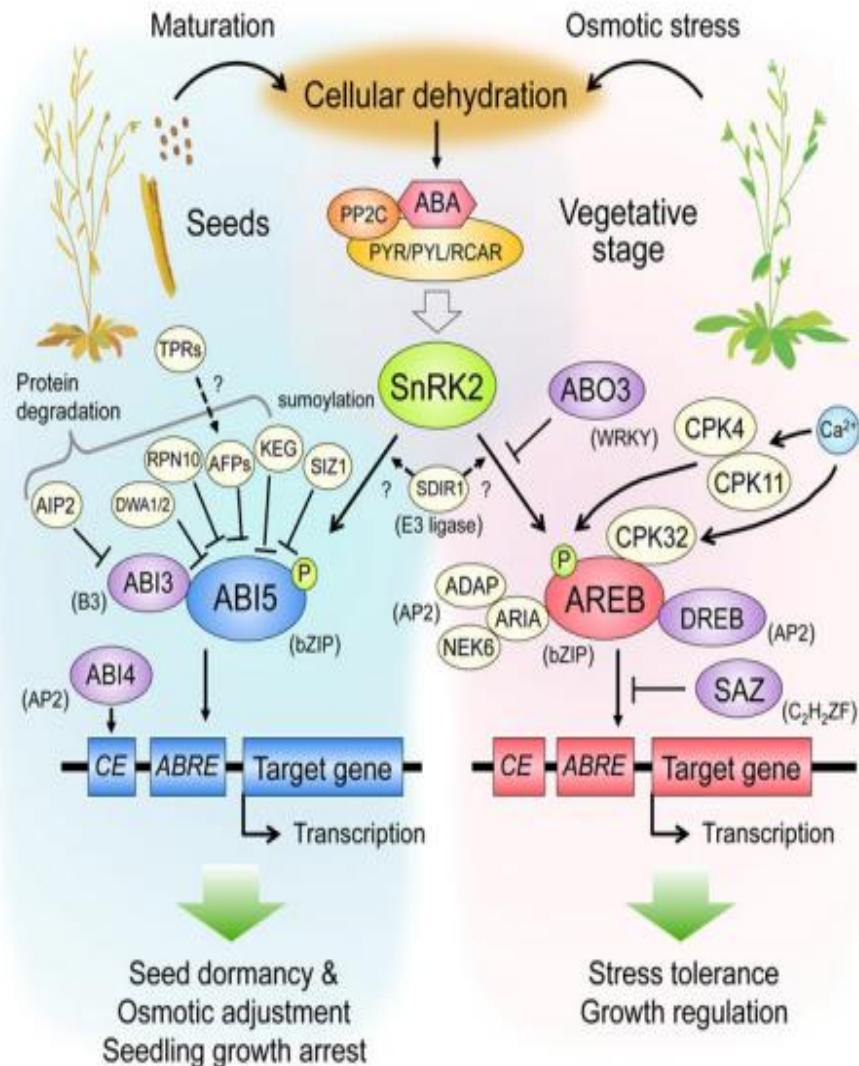

3. Cellular dehydration during the seed maturation

4. control many dehydration responsive genes in vegetative growth stages .

(Yasunari Fujita et al., 2011)

While a large number of signaling factors have been identified that are involved in stomata regulation by ABA, relatively less is known about the ABA-signaling pathway that leads to **gene expression**. (Yuhko Kobayashi et al., 2005)

SnRK2 family members

- plant-specific serine/threonine kinases
- in plant response to abiotic stresses
abscisic acid (ABA)-dependent plant development.
- SnRK2s have been classed into three groups:
group 1 comprises kinases **not** activated by ABA
group 2 comprises kinases not activated or activated
very weakly by ABA
group 3 comprises kinases **strongly** activated by ABA.

(Anna Kulik et al., 2011)

SnRK2 family in Rice

- all members of the rice SnRK2 family, designated SAPK1–10, are activated in response to hyperosmotic stress via phosphorylation by an unidentified upstream protein kinase, and that SAPK8, **SAPK9** and SAPK10 are also activated by ABA (Kobayashi et al., 2004).

Our goal

- SAPK9 3D Structure
- SAPK9 function in ABA-signaling pathway leading to gene expression

SAPK9 Primary Structure Analysis

Phylogenetic Analysis

- Using Blast to search the ten sequences (SAPK1-10) from the SnRKs family of *Oryza sativa* and the ten sequences (SRK2A-SRK2J) from the SnRKs family of *Arabidopsis thaliana*.
- Using MEGA5.0 to construct a neighbor-joining tree of the 20 sequences.

Structure of *Arabidopsis thaliana* SnRK2s

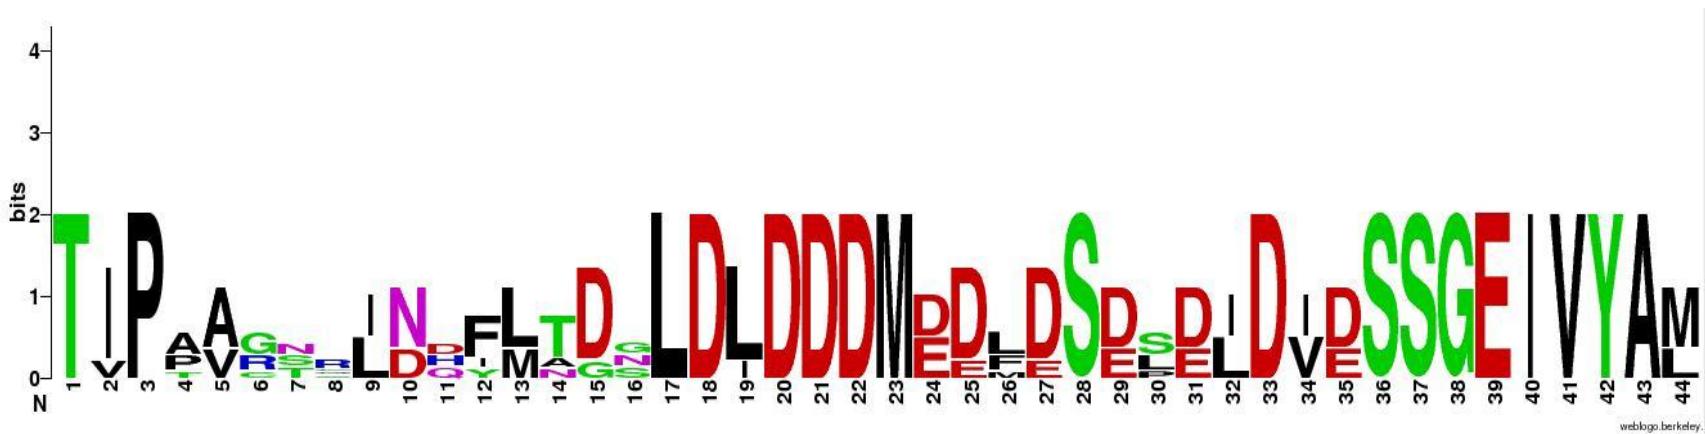

- Ser/Thr kinase domain — kinase catalytic
- domain, I — domain involved in ABA-independent activation in response to osmotic stress, characteristic for all SnRK2.
- Domain, II — needed for ABA-dependent activation of SnRK2s.

(Anna Kulik et al., 2011)

SRK2E: Interaction between chains

Goal 2 : SAPK9 function in ABA-signaling pathway leading to gene expression

TRAB1 [Close](#)

Actions

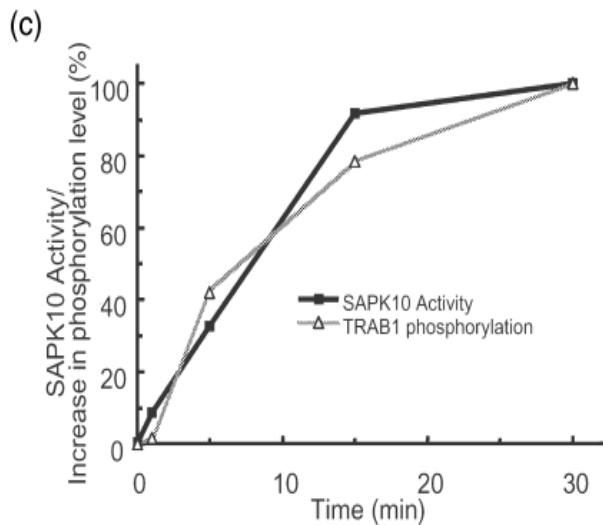

- [re-center network on this node](#)
- [add this node to input nodes](#)

Information

Os08g0472000 ; Transcription activator that mediates abscisic acid (ABA) signaling. Binds specifically to the ABA-responsive element (ABRE) of the EMP1 and RAB16A gene promoters

Identifier: BGIOSIBCE028180 [UniProt](#)

SAPK10 directly phosphorylates TRAB1

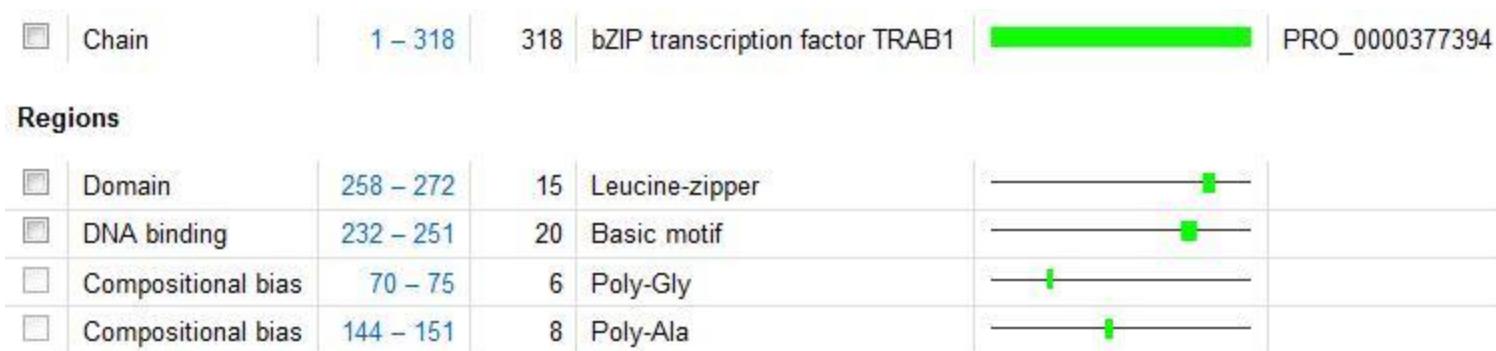

SAPK10 activities (closed squares) and TRAB1 phosphorylation levels (open triangles) were quantified using the radioactive and luminescence images obtained in the experiments. SAPK10 activities were normalized by immunoblot signals. Changes in the levels of Ser102-phosphorylation in TRAB1 were expressed as the increase in S-band intensity/total band intensity at each time point relative to the 0-min value.

(Yuhko Kobayashi et al., 2005)
